

Name: Key (please print)

1. 2. 3. 4. 5. 6. 7. 8. Total \_\_\_\_\_

1. (10 pts) Draw all the isomers of "chloropentane,"  $C_5H_{11}Cl$ .

-2-

2/17/99

2. (10 pts) What is the approximate hybridization of carbon in each of the following compounds?

3. (10 pts) Draw Newman projections of *all* the eclipsed and staggered conformations of 1,2-dichloropropane by looking down the C<sub>1</sub>-C<sub>2</sub> bond.

4. (10 pts) A. Draw structures for:

i) (E)-3-fluoro-3-hexene

Z

ii) (E)-4-ethyl-3-heptene

Z

iii) (Z)-1-bromo-2-chloro-2-fluoro-1-iodoethylene

Z

B. Which of the following alkenes is capable of (Z/E) isomerization?

4

no

no

yes

yes

no

5. (10 pts) Write structures for all the isomers of dibromocyclobutane. Which ones have zero dipole moment?

$\mu_D = 0$  here

-1 for repeats

6. (15 pts) Contrast  $\text{CH}_3\text{CH}_2\text{CH}_2\text{Cl}$  and  $\text{CH}_3\text{CH}=\text{CHCl}$ .

- How many isomers of  $\text{CH}_3\text{CH}_2\text{CH}_2\text{Cl}$  are there (separate molecules that can be put in a bottle)? Name them. *1-chlorobutane is the only isomer*
- How many isomers of  $\text{CH}_3\text{CH}=\text{CHCl}$  are there? Name them. Why don't these alkenes interconvert at room temperature?

*Z*-1-chloro-1-propene

*E*-1-chloro-1-propene

These isomers cannot interconvert because the double bond must be broken for rotation to occur.

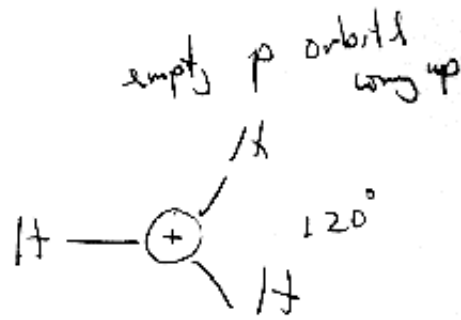

7. (15 pts) Consider the molecules:  $\text{CH}_4$ ,  $\text{CH}_3^+$ , and  $\text{CH}_3^-$ .

- Draw an explicit structure for each species.
- What is the hybridization of each carbon?

or

8. (15 pts) Draw the Newman projection for looking down the C<sub>2</sub>-C<sub>3</sub> bond in 2,3-dimethylbutane. Make a graph of the conformational energy as a function of dihedral angle,  $\theta$ . Start your graph at  $\theta = 0^\circ$ , the conformation that is symmetrically eclipsed.
